

OG BIO BREW

OG BIOWAR recommends applying the ROOT and FOLIAR packs via BIO BREW weekly for optimum results! Here is a simple method how:

- 1) Fill a 5 gallon bucket with 4 gallons of NON CHLORINATED water.
- 2) Add 100 ml of regular unsulphured black strap molasses. You can find this in the grocery store where the maple syrup is.
- 3) For soil or hydro add 4 tablespoons each of the ROOT PACK and the FOLIAR PACK. SOIL/COCO users may add 1 tsp of the nute pack during the vegetative phase only. Mix well, and make sure to break up all the clumps.
- 4) Fill a stocking with 1-2 cups of earth worm castings. Tie this off and let it float in the solution like a tea bag. You can also just throw a couple cups in to the bucket without the stocking. Straining is a preference when watering in, but is a must when spraying.
- 5) Bubble with a large air stone and air pump rated for at least 80 Liters per minute. OGBIOWAR likes a 24 hour BIO BREW. Make sure the air stone or air disc is heavy enough so that it sits at the bottom of the bucket.
- 6) Turn off air pump, **let settle** and take/pour brew off the top to avoid sediment. The talc carrier will be sticking to the bottom of the bucket. Make sure you rinse and wash your bucket and air stone well when you are done.
- 7) dilute 1 to 2 cups of brew to every 5 gallons of stock solution for re-circulating or drain to waste systems, or use as an individual drench via hand watering. This works GREAT in a cloning machine, or even on your cuttings in a dome if you soak the media prior to placing the cutting. Make sure to add any nutrients or additives and pH BEFORE adding the brew. The day after a reservoir change (once every 7-10 days) is a good time to apply. Make sure you have a re-circulating pump in your reservoir to avoid stagnant water. It is also advised to foliar feed with this tea once a week diluted 50/50 with non chlorinated water. Strain it or take liquid off the top, so that it doesn't clog the sprayer.
- 8) Rinse out sediment in bucket for future batches. Clean tubing, air stone, and bucket thoroughly in between brews.

If you are battling an existing pest or pathogen problem, use at full strength, without diluting. Pour tea directly in to crown and foliar as well.

Can be used up to harvest/flush.
