

OG BIO WAR recommends applying the ROOT and FOLIAR packs via BIO BREW weekly for optimum results! Here is a simple method how:

- 1) Fill a 5 gallon bucket with 4 gallons of NON CHLORINATED water.
- 2) Add 100 ml of regular unsulphured black strap molasses. You can find this in the grocery store where the maple syrup is.
- 3) For soil or hydro add 4 tablespoons of the ROOT PACK and the FOLIAR PACK. SOIL/COCO users may add 4 teaspoons of the nute pack when the brew is done during the vegetative phase only. Mix well, and make sure to break up all the clumps.
- 4) Fill a stocking with 1-2 cups of earth worm castings. Tie this off and let it float in the solution like a tea bag. You can also just throw a couple cups in to the bucket without the stocking. Straining is a preference when watering in, but is a must when spraying.
- 5) Bubble with a large air stone and air pump rated for at least 60 Liters per minute. For max diversity, OGBIOWAR likes a short 2 to 4 hour BIO BREW, but you may brew up to 24 hours. Make sure the air stone or air disc is heavy enough so that it sits at the bottom of the bucket.
- 6) Turn off air pump, **let settle** and take/pour brew off the top to avoid sediment. The talc carrier will be sticking to the bottom of the bucket. Make sure you rinse and wash your bucket and air stone well when you are done.
- 7) Dilute 1 to 2 cups of brew to every 5 gallons of stock solution for re-circulating hydro systems or 1 part brew to 10 parts stock solution for drain to waste soil/coco/peat. 1 cup per 5 gallons in a cloning machine. Make sure to add any nutrients or additives to stock solution and pH BEFORE adding the brew. The day after a reservoir change (once every 7-10 days) is a good time to apply. Make sure you have a re-circulating pump in your reservoir to avoid stagnant water. Foliar feed with brew once a week at full concentrate. Just strain it so that it doesn't clog the sprayer.
- 8) Rinse out sediment in bucket for future batches. Clean tubing, air stone, and bucket thoroughly in between brews.

If you are battling an existing pest or pathogen problem, use foliar pack at full strength, without diluting. Pour tea directly in to crown. Spray thoroughly at lights off with no fans or AC running for 2 hours.

Can be used up to harvest/flush.
